

e-SOTER

Regional pilot platform as EU contribution to a
Global Soil Observing System

Enhancing the terrain component in
SOTER database

Joanna Zawadzka

- Overview of tested methods for terrain analysis
 - Benchmark datasets
 - New methods
 - Physical entities (hill shed analysis)
 - Homogenous segments (object-based segmentation)
- Assessment
 - Cramer's V statistic
 - Bayesian Networks
- Recommendations for e-SOTER

- Methods found in literature

One of the ways to overcome the limitations of grid based methods is incorporation of **objects** into methodology of landform classification

- Search windows of fixed sizes

- Limitations:
 - Sensitive to grid size
 - Sensitive to window size
 - Scale of the landscape may not be represented by the combination of the two factors

900m diameter

7200m diameter

18000m diameter

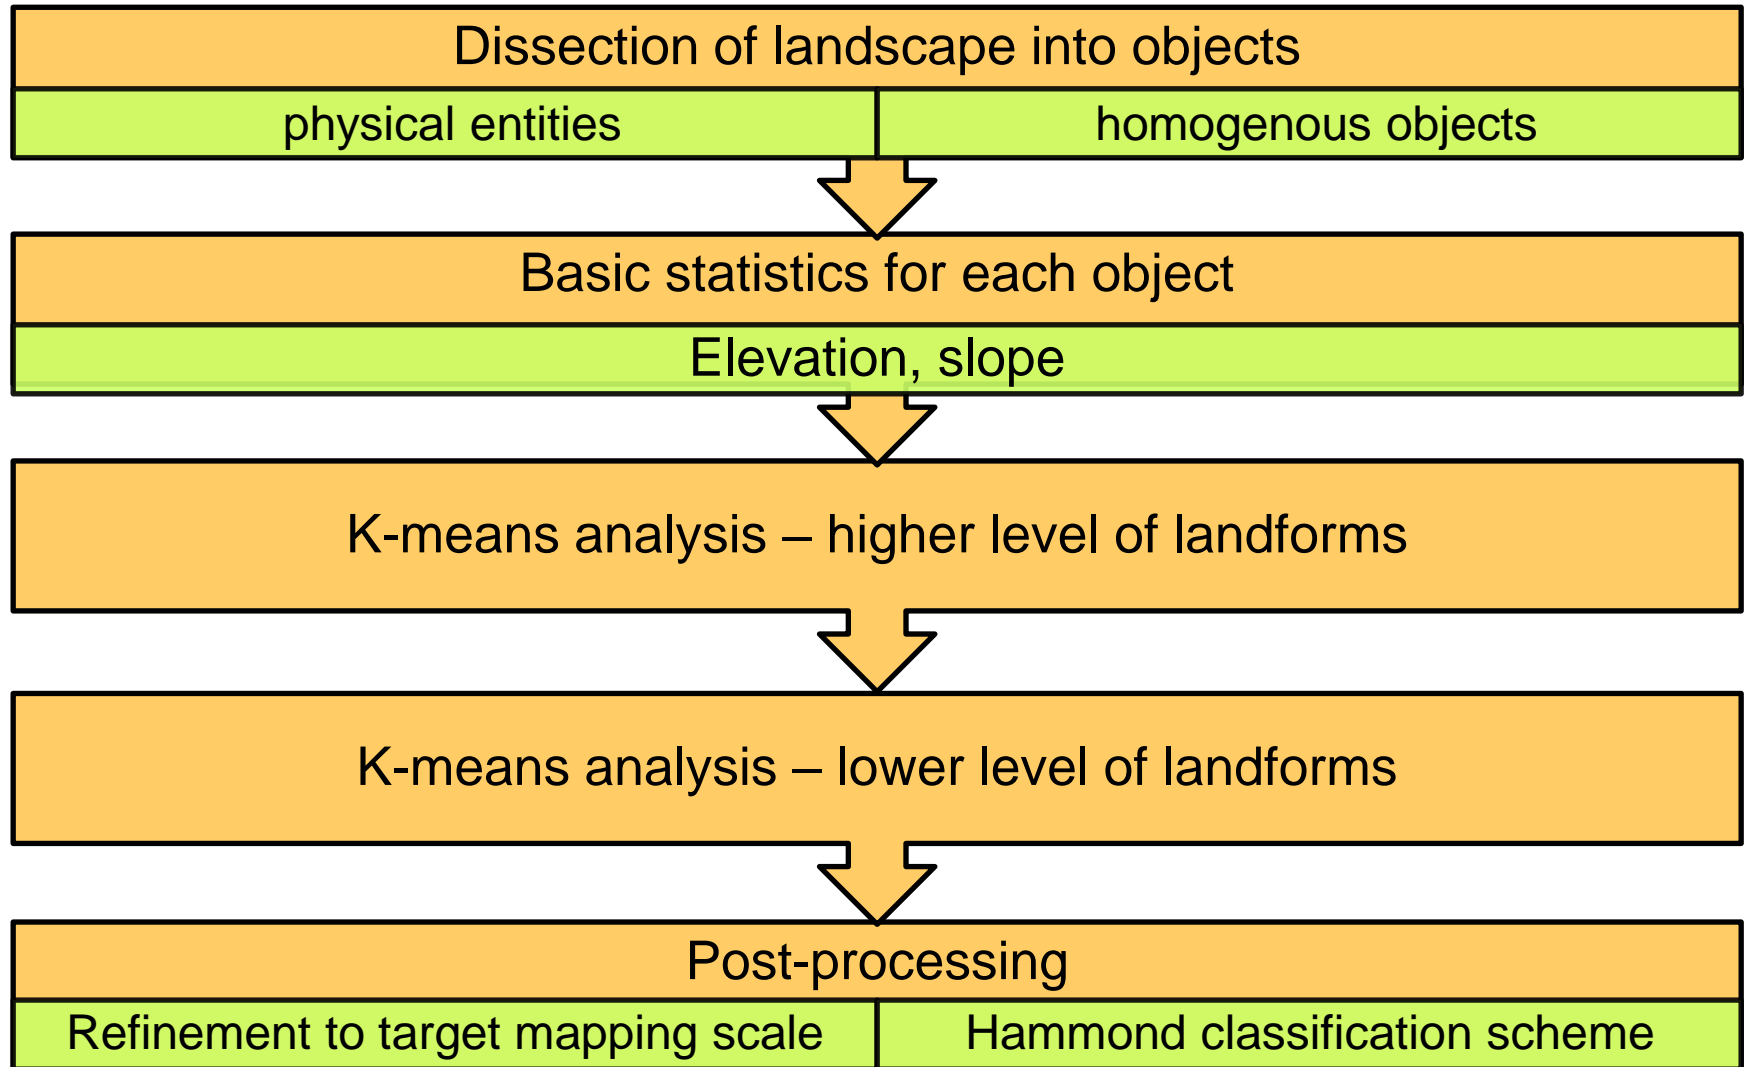

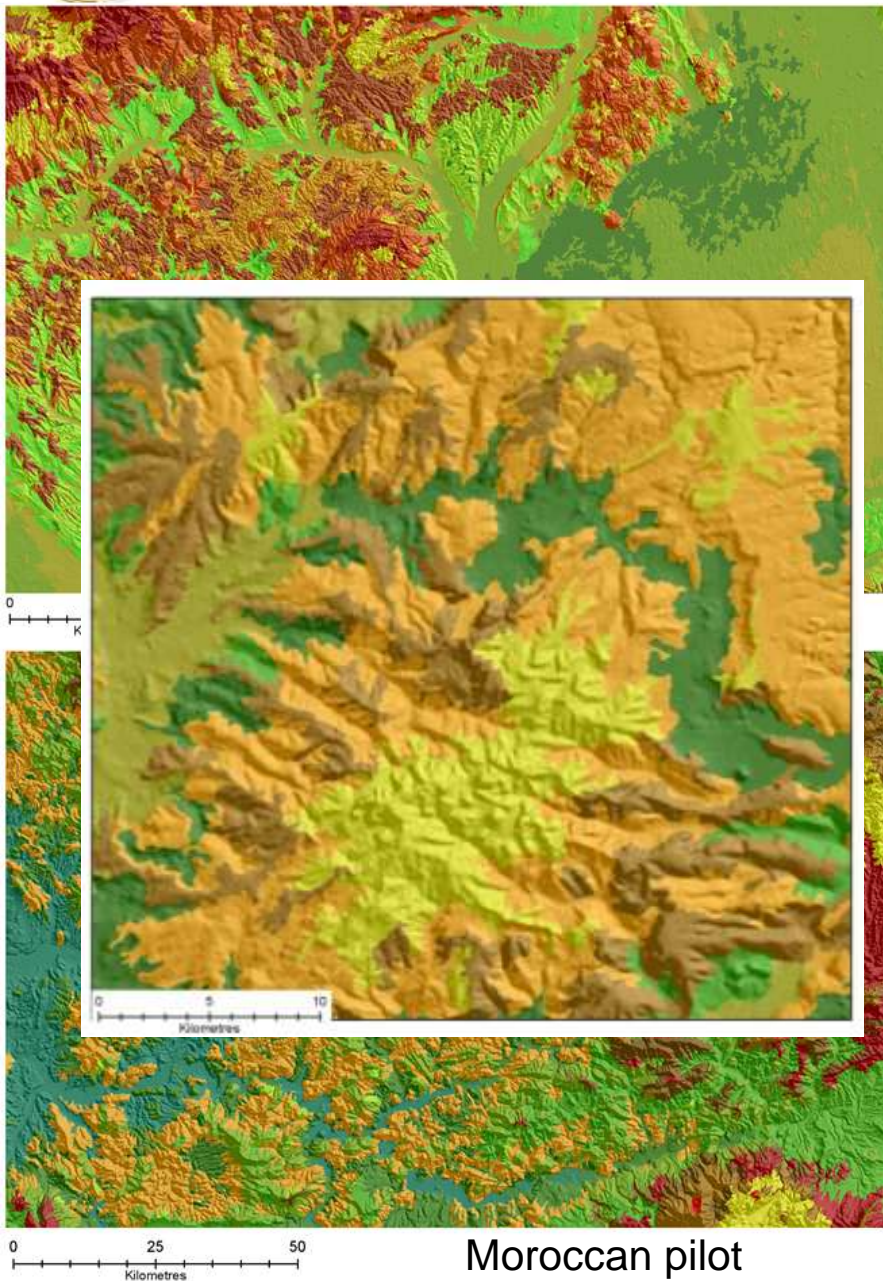

Peak sheds

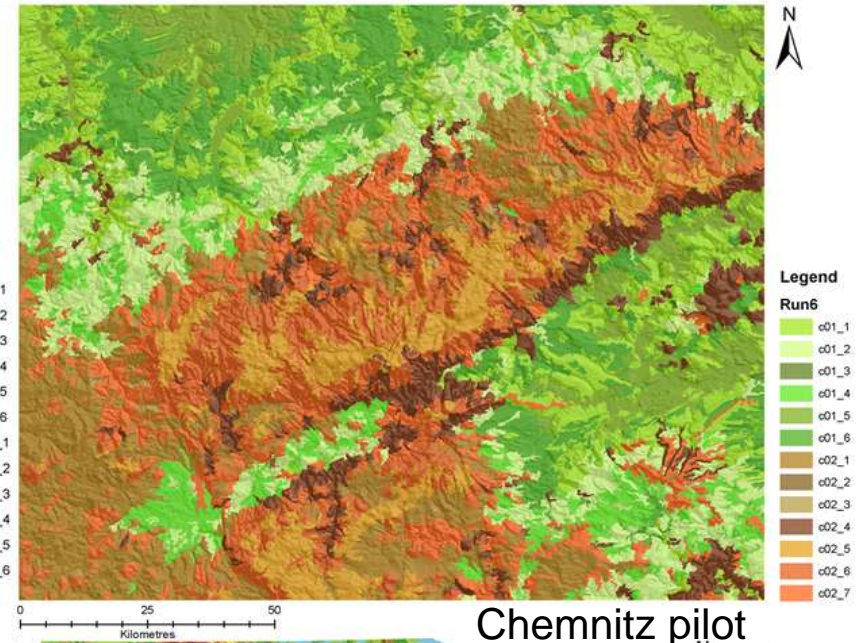

Peak sheds + slope breaks

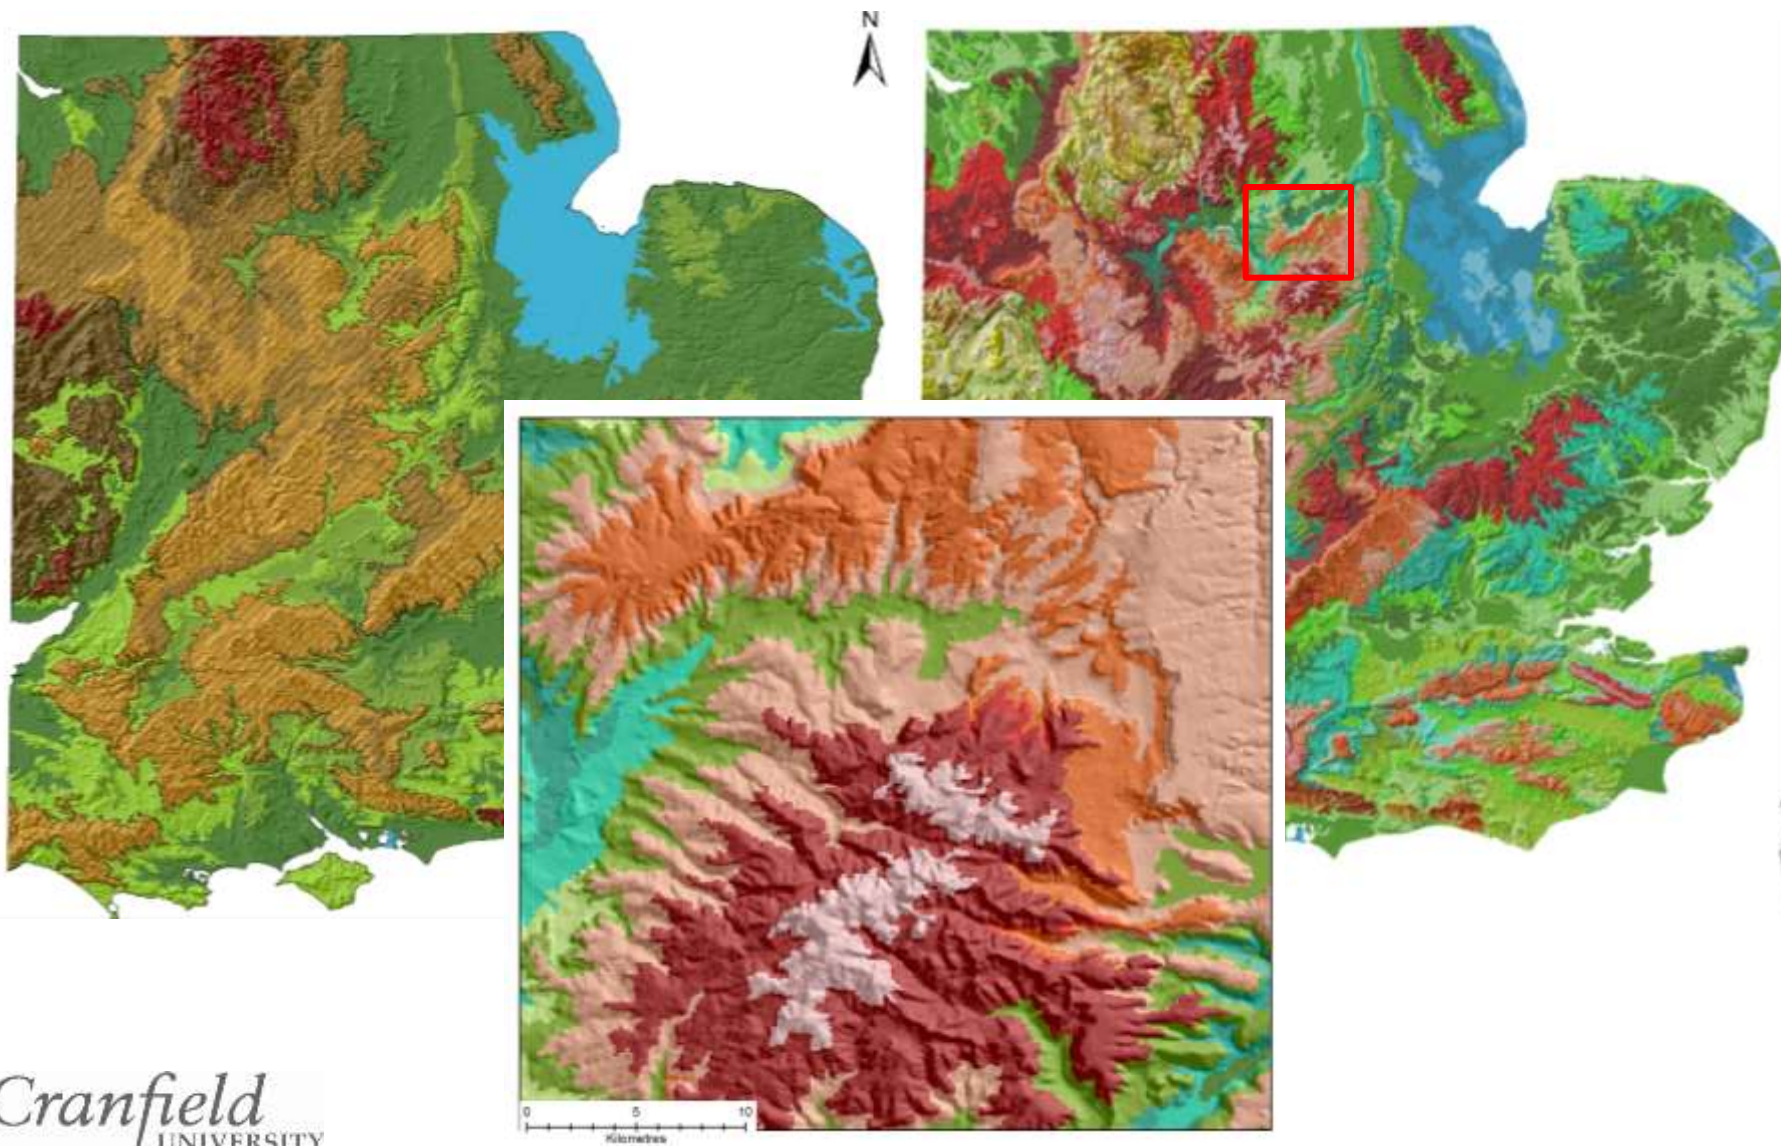

Moroccan pilot

Chemnitz pilot

UK window

- Hammond classifiers:
 - Slope – occurrence of slope $<8\%$
 - Local relief
 - Profile type – occurrence of lowlands
- Each cluster was characterised with the values of the three classifiers extracted within:
 - peak sheds
 - object-oriented segmentation
- Three-character code applied to ranges of Hammond classifiers (Dikau et al., 1991) → landform **subclass**
- **Landform class and type** assigned to each subclass

SOIL

NATMAP 1:250k (255)

**SOILSCAPE/
LANDSCAPE**

- Similarity measure between maps of different legends and different numbers

- Calculation

V

Scatterplot 3D
Final Configuration
Dimension 1 vs. Dimension 2 vs. Dimension 3

$$i)^2 / E_{ij}$$

- Calculation

- Multivariate

- List of distances in all dimensions

sets

and all

- Bayesian Belief Networks set to predict validation datasets with the use of various landform maps obtained in the project
- ‘Sensitivity to findings’ lists for each validation dataset – ordering according to the value of entropy reduction
- Indication of importance of each landform map
- Based on a sub-sample of regular points (~300k observations)

- Both methods give different but not dissimilar results
- **Bayesian Networks** favour approaches based on homogenous objects
- **Cramer's V statistic** finds more value in approaches based on physical entities.
